

Release Notes

For Uinta Windows & Android 1.7.2

These notes provide important information for Juniper Systems' release of Uinta 1.7.2 for Windows and Android.

Documentation and software updates are located on the Juniper Systems website: <https://junipersys.com/support/uinta>

New Features

- **Simplified data entry:** The default value capability now allows for retention of previous values and can be enabled by selecting this option in the form editor for select lists and text fields. This simplifies data entry by prepopulating fields with the last entered values when the Retained option is enabled for a field.

Bug Fixes

- Allow importing into a nested relationship when performing a quick import.
- Labels for points, lines, and polygons that included a string description of the geometry display properly on the map.
- Clicking on a relationship field while in card view now shows the card for that relationship rather than directly entering edit mode.
- When adding new records in a related table, the column values refresh when editing is complete.
- Attachments nested in a tab or subsection export correctly.

- Select lists with multi-select enabled export all values when saving to excel format (not just the first value).
- Invalid points in line and area geometry are removed by moving the geometry and immediately saving the edit. Saving the edit will also fix any issues with the area or length calculations for polygons and polylines.
- Fixed sort order problems in to-do lists.
- Using the Tab key on a physical keyboard to move through fields on a horizontal form layout functions correctly.
- Conditional logic behaves the same on both Android and Windows version of Uinta.
- Avoid Android lockup when previewing a photo.
- Quick text search button works for to-do list.
- Allow the context record history to be viewed while editing a record by tapping on the related record and viewing the history tab.
- Fixed issue where filters weren't applied properly when clicking on linked records from the record details screen.
- Field level filters now work correctly when multiple filters are applied to the same data type
- To-do list searches all nested relationships for up to 500 records. (Limit increased from 300 records.)
- Various performance and stability fixes.
