

# Release Notes

## For Uinta Windows 1.5.6

These notes include important information for Juniper Systems' release of Uinta 1.5.6 for Windows 10.

Documentation and software updates are located on the Juniper Systems website:

<https://junipersys.com/support/uinta>

### New Features and Enhancements

- Export one record per page for PDF exports.

### Bug Fixes

- The KML importer will now support importing polygons that have one vertex.
- The sort ordering problems on record names that include numbers have been fixed.
- The PDF export using the List layout now includes a full sized image rather than a thumbnail.

### Known Issues

- **Backwards compatibility:** Devices sharing data in a cloud project should use the same version of Uinta. New features in Uinta 1.5 and later are not backwards compatible and could cause older versions to crash.
- **Large data sets:** Importing large data sets (10,000+ features/records) into a cloud project is not recommended at this time. Using offline reference layers such as mbtiles is preferred. This issue will be addressed in a future version. Please contact Juniper Systems if you need help supporting large data sets.
